

Key

1. Explain how currying works.¹

Currying involves taking an n-place function and breaking it down into a sequence of n-many 1-place functions.

2. Fill in the blank spots

(1) $\{ x \in D \mid \{ y \in D \mid y \text{ saw } x \} \}$	$f : D \rightarrow \{ g \mid g : D \rightarrow \{ 1, 0 \} \}$ for all $x \in D$, $f(x) =$ $g : D \rightarrow \{ 1, 0 \}$ for all $y \in D$, $g(y) = 1$ iff y saw x	<u>$\lambda x \in D. \lambda y \in D. \text{saw}(x)(y)$</u>
(2) $\{ x \in D \mid \{ z \in D \mid z \text{ knows } x \} \}$	$f : D \rightarrow \{ g \mid g : D \rightarrow \{ 1, 0 \} \}$ for all $x \in D$, $f(x) =$ $g : D \rightarrow \{ 1, 0 \}$ for all $z \in D$, $g(z) = 1$ iff z knows x	<u>$\lambda x \in D. \lambda z \in D. \text{knows}(x)(z)$</u>
(3) $\{ x \in D \mid \{ y \in D \mid y \text{ likes } x \} \}$	<u>$f : D \rightarrow \{ g \mid g : D \rightarrow \{ 1, 0 \} \}$</u> for all $x \in D$, $f(x) =$ $g : D \rightarrow \{ 1, 0 \}$ for all $y \in D$, $g(y) = 1$ iff y likes x	$\lambda x \in D. \lambda y \in D. \text{likes}(x)(y)$

3. β -Convert each of the following λ -expressions (*i.e.* give the result of plugging in these arguments). Then, give the English expression that corresponds to that result.

1. $[\lambda z \in D. \lambda y \in D. \text{hugged}(z)(y)](\text{Asia})(\text{Yolanda})$ hugged(Asia)(Yolanda) ; Yolanda hugged Asia

2. $[\lambda x \in D. \lambda y \in D. \text{called}(x)(y)](\text{Imogen})(\text{Barry})$ called(Imogen)(Barry) Barry called Imogen

4. Write the denotations of the following English expressions as functions, using the λ -notation.

1. *smash* $\lambda x \in D. \lambda y \in D. \text{smash}(x)(y)$

2. *carry* $\lambda x \in D. \lambda y \in D. \text{carry}(x)(y)$

¹or: Explain how schönfinkelization works.
